

A Progressive Unified Communications Solution

CTL's *VoiceSupport Lx* for small and medium businesses is a progressive unified messaging, voice mail, and automated attendant solution that will facilitate all of a company's communication needs. The *VoiceSupport Lx* leverages the Linux operating system for its strong performance and reliability. The *VoiceSupport Lx* is the most cost-effective and full-featured unified messaging solution on the market today and can be integrated with virtually any phone system.

Voice Mail with Auto Attendant

The *VoiceSupport Lx*'s **Voice Mail** is the most dynamic and feature-rich messaging solution designed to satisfy the most demanding power users. Subscribers and callers can stay in touch with each other from any place, at any time.

The *VoiceSupport Lx*'s **automated attendant** greets callers with a prerecorded message based on your organization's time schedules e.g., weekends, after hours, holidays, inclement weather closures, etc. The endless flexibility allows your callers to be quickly and efficiently routed with minimal human intervention.

Advanced Features

Unified Messaging

Allows users to access their voice, fax, and Email messages in their Microsoft Exchange/Outlook client or any SMTP/POP3/IMAP4 compliant Email server.

Text-to-Speech

Users can listen to their own Email over the telephone. The user can then decide to save it, delete it, or forward it to a co-worker. The user can even record a voice message reply which will go back to the sender as a .WAV file Email Attachment.

Automated Speech Recognition (ASR)

Instead of keying a person's extension to reach them via the Automated Attendant, the Automated Speech Recognition (ASR) feature allows a caller to just speak the name of the person or department they want to reach.

Desktop Call Control

Provides each LAN user with a screen-pop of options for every incoming call. The screen-pop shows the caller ID of the incoming call, and if it matches a telephone number in the user's Email Contact List, it will show the caller's name. The user can choose to take the call, transfer it to

another extension, put the call on hold, or send the caller to voice mail.

Fax Server

Desktop Fax enables any LAN user to send any document from any application, maximizing user productivity. Any document that can be printed can be faxed out using the *VoiceSupport Lx* fax ports.

Fax Mail enables a caller to send a fax directly into a subscriber's mailbox. When the subscribers access their mailbox (Local or Remote), they have the option of sending the fax to a fax machine, forwarding it to another subscriber, saving it or deleting it.

Fax-on-demand enables callers to request that documents be routed to their fax machine or unified messaging inbox for viewing, independent of time zones, 24/7/365.

Web Administration

System Administration of the *VoiceSupport Lx* can take place on site or from a remote location. Any workstation connected to a network can access the user interface which provides menu driven choices for installing, configuring, and managing the voice mail system.
